

Built to Code

Manufactured homes constructed to HUD Code

Manufactured (i.e. HUD code) homes are built to federal building standards, the Federal Manufactured Home Construction Safety Standards.

The HUD code regulates the design, construction, structural durability, transportability, fire resistance and energy efficiency of a home. It also prescribes performance standards for the mechanical, plumbing and electrical systems. Manufactured homes are built and shipped on a permanent chassis.

Consistent quality begins with care for detail.

Manufactured homes are inspected frequently at the assembly plant during each phase of construction. In-plant inspectors, as well as independent agencies, inspect your home on behalf of federal, state and local governments for code compliance. Evidence of this inspection is the application of a federal, state or inspection agency label of approval.
